Last Updated on STN: 5 May 1999

AB Nutmeg and mace oils, produced by supercritical CO₂ extraction, are now increasingly traded. Unlike the steam-distilled oils, no information about their composition is published. Supercritical CO₂ nutmeg and mace extracts from the East Indies, West Indies and Papua were analysed by high-performance liquid chromatography (HPLC) for myristicin, safrole, elemicin, eugenol, methyleugenol, isoeugenol, methylisoeugenol, methoxyeugenol and isoelemicin, and were very similar to steam-distilled oils from the same batch. East Indian, West Indian and Papuan oils displayed clear differences in their composition and could be clearly characterized by HPLC. The dominating aromatic ether in the East Indian oils was myristicin, in West Indian elemicin and in Papuan safrole.

CC 29 (Essential Oils and Cosmetics)

AB Three East Indian (I) and one **West Indian** (II)

varieties of **nutmeg oil** were analyzed by gas chromatog. All 4 contained α -pinene, β -pinene, limonene, p-cymene, 4-terpinenol, α -terpineol, and an unknown substance.

Small amts. of terpinolene were found in two samples of I; linalool and geraniol were absent from one sample of I, safrole and eugenol were present in all samples of I but not in II, and camphor was found only in II.
